# Heartbeat Script Design Doc

**What the user needs to know:**

- What is going wrong
- Where her attention is needed
- Whether projects are on track
- What might become a problem soon

**What is in the digest:**

- **Critical issues:** unhappy clients, missed deadlines, blockers
- **Client updates:** important emails, pending replies, escalations
- **Project progress:** tasks done, delayed, current status
- **Upcoming risks:** deadlines (24–48 hrs), at-risk or blocked work

**How urgency is decided:**

- Email unread > 4 hours
- Task due today with no progress
- Meeting in 90 minutes without preparation
  → Urgent items shown at top

**Tools and MCP servers:**

- Gmail → client emails and reply status
- Google Calendar → meetings and time-based urgency
- Jira → task progress and delays
- Notion → store past digests

**Why these tools:**

- Already used in workflow
- Provide structured, reliable data
- Fewer tools reduce complexity and errors

**Delivery:**

- Slack DM bot notification using MCP

**Hardest calls:**

- Fewer tools → less visibility
- No AI summaries → less convenience
- Rule-based logic → less smart

- Short digest → may miss details, but reduces noise

Format of Digest:

**3:00 PM Update**

**1 Critical Issue**

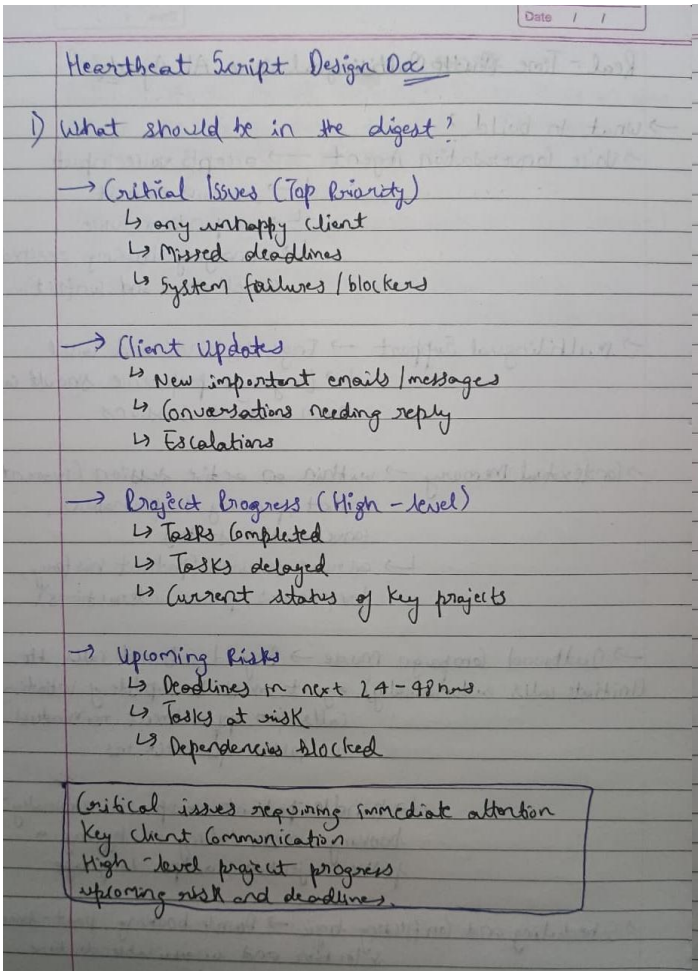
- Client X unhappy with delay

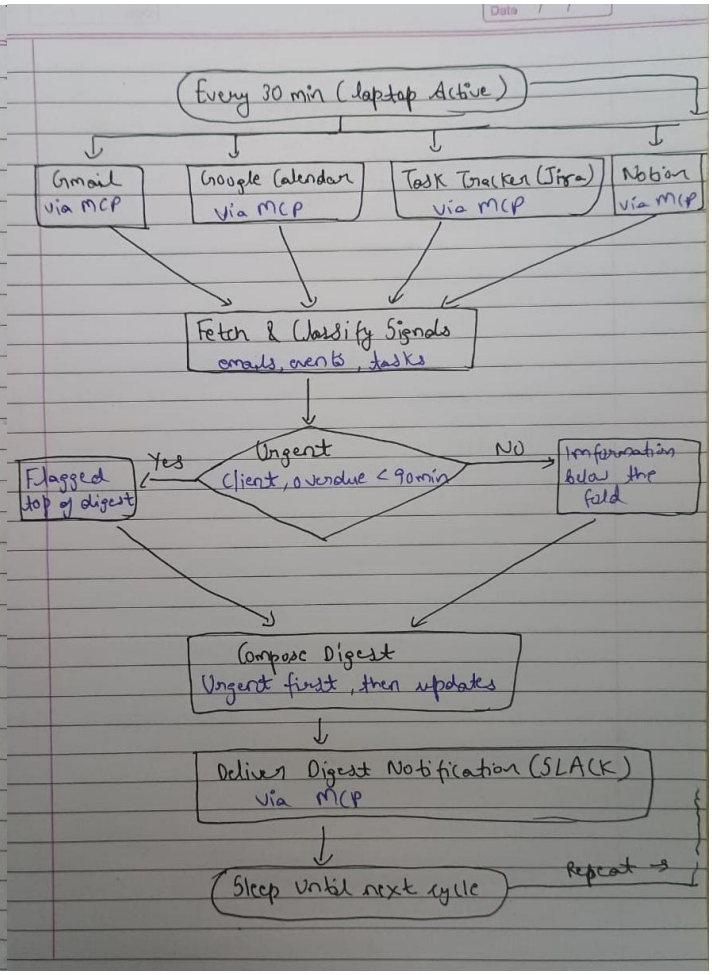
**2 Client Updates**

- New email from Client Y
- Follow-up pending

**Project Status**

- 5 tasks completed
- 2 delayed

**Risks**




- Deadline tomorrow for Project Z
